

## SYNOPSIS

FlexInLight is a unique solution of special interest to the healthcare market. The semi-automated lighting system is fully compatible with air handling systems offering unidirectional flow (UDF) and seamlessly integrates within existing infrastructure.

The direction of the light beam is steered by a pointing device and/or tablet which provides immediate focus and real-time accuracy. An intensity of minimal 100.000 lux removes the danger of shadows and provides a crisp view of any selected area. Since the lights are directly attached to the plenum there is a higher level of asepsis due to an unobstructed air flow.

The built-in artificial vision system consistently delivers the best mixture of light for optimal zenithal (overhead) light and shadow avoidance.

This intelligent operating room lighting system delivers quality, resolution, consistency, and efficiency.
